## ABSTRACT

[0075] tolerant Α fault processing circuit comprising at least three processor groupings, synchronizing circuit and a fault logic circuit. Each of the processor groupings have a plurality of inputs and processor grouping a plurality The processor grouping outputs. synchronizing comprises plurality of output circuit a synchronizer synchronizers, wherein each output with corresponding respective communicates a processor grouping for synchronizing the output of fault each processor grouping. Α logic with the synchronizing circuit. communicates fault detection fault logic circuit comprises a circuit and a fault mask circuit. The fault logic circuit compares the plurality of processor group outputs to detect errors in any one of the plurality of processor group outputs. An error is detected when none of the at least three processor groups is in a majority of the processor groups. Upon a detected fault, the fault mask circuit masks the output of the respective processor grouping associated with detected error and signals a detected error. The latch is then used the error signal to reset processor groupings.
